ALTER · PERSONAL AGENT AT THE OS LAYER

Your model follows you across every app and device.

It reads along, helps before you ask, and stays out of the way. You can see everything it knows, and change it.

- **Quiet by default**
  Appears only when you call it (⌘E) or when a small signal shows: you are stuck on a paragraph, a form is waiting.
- **Yours to see and edit**
  Every fact has a source and a confidence. Edit it, delete it, switch learning off. Passwords, payments and banks are never touched.
- **Playful, never pushy**
  Daily rings per interest fill with minutes of real use. Nothing is ever taken away.

HOW IT WORKS

One brain, many sensors. A faster, cheaper brain over time.

Sensors

thin, one per OS, each through its sanctioned API

- **LIVE** Browser: selection, forms, reading. Phone: same Alter via QR.
- **NEXT** macOS Accessibility API · Windows UI Automation · Android Autofill + assistant role · iOS Safari extension + share sheet

Brain

the same everywhere

- **LIVE** Context store: each fact has a source, a confidence, and an owner who can edit it.
- **LIVE** Safety rules in code, not prompts: passwords, payments and banks are never read.
- **LIVE** Learns how you like to be helped: open or pass, and goes quiet when you pass.

Models, cheapest first

most interactions never reach a cloud model

0. **Code**: standard fields, rules. Zero cost, instant. **Live**
1. **OS on-device model**: private first pass (strip personal data, classify). Apple Foundation Models, Android Gemini Nano (ML Kit GenAI), Windows AI APIs. **Next**
2. **Claude Haiku 5.5**: explain, draft, decide. **Live**
3. **Larger Claude**: only for hard tasks. **As needed**

Next for tier 2: specialized decision models (typed questions in, calibrated probabilities out) and fast diffusion language models, behind the same interface. **Not used in this submission; every AI call in this demo is Claude.**

Why now: every major OS now ships an on-device model to developers, and fast specialized models make "should Alter speak now?" cheap enough to ask constantly. The brain stays the same; each new device is a thin sensor, not a rewrite.

Built today · new repository, no earlier code · alter-demo-gamma.vercel.app
